Background Information

FEM1B, also named F1AA, and KIAA0396 is a 627 amino acid protein, which belongs to the fem-1 family. FEM1B is highly expressed in the testis and weakly expressed in other tissues. FEM1B localizes both in the nucleus and cytoplasm. In the nucleus, the protein level increased slightly after camptothecin (CPT) treatment. FEM1B is a component of an E3 ubiquitin-protein ligase complex, in which it may act as a substrate recognition subunit. FEM1B is involved in apoptosis by acting as a death receptor-associated protein that mediates apoptosis. FEM1B is also involved in glucose homeostasis in pancreatic islets. FEM1B functions as an adapter/mediator in replication stress-induced signaling that leads to the activation of CHEK1.
