## Background Information

CAMKK2 (calcium/calmodulin-dependent protein kinase kinase 2) is also named as CAMKKB, KIAA0787 and belongs to the protein kinase superfamily. It regulates hypothalamic production of the orexigenic hormone NPY and contributes to the regulation of energy balance. CAMKK2 in vivo reduces tumor growth suggests that reactivation of CAMKK2 by development of new drugs may be a new strategy to prolong the period to respond androgen-deprivation therapy (ADT) (PMID:22549914). It can be autophosphorylated (PMID:19369195). It has 7 isoforms produced by alternative splicing.
