Background Information

RAD23B, also named as p58, hHR23B and HR23B, belongs to the RAD23 family. It plays a central role both in proteasomal degradation of misfolded proteins and DNA repair. RAD23B is a central component of a complex required to couple deglycosylation and proteasome-mediated degradation of misfolded proteins in the endoplasmic reticulum that are retrotranslocated in the cytosol. Involved in DNA excision repair by stabilizing XPC protein. It may play a part in DNA damage recognition and/or in altering chromatin structure to allow access by damage-processing enzymes. RAD23B displays aberrant mobility in SDS-polyacrylamide gels, as it is typically detected as a 58- to 60-kDa protein despite a predicted size of 42 kDa (PMID: 8692695, 12052895).

Selected Validation Data

Immunohistochemical analysis of paraffin-embedded human breast cancer tissue slide using 12121-1-AP (RAD23B antibody) at dilution of 1:100 (under 10x lens. Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0).

Various lysates were subjected to SDS PAGE followed by western blot with 12121-1-AP (RAD23B antibody) at dilution of 1:1500 incubated at room temperature for 1.5 hours.
