## Background Information

ACTL7B is also named as actin-like-7-beta. The protein encoded by this gene is a member of a family of actin-related proteins (ARPs) which share significant amino acid sequence identity to conventional actins. The ARPs are involved in diverse cellular processes, including vesicular transport, spindle orientation, nuclear migration and chromatin remodeling. The ACTL7B gene is expressed predominantly in the testis, however, its exact function is not known. Diseases associated with ACTL7B include Dysautonomia and Hypertensive Nephropathy. An important paralog of this gene is ACTL7A. ACTL7B can be detected as 45 kDa.
