Background Information

KDM5C belongs to the ARID protein family that harbors conserved DNA-binding motifs and acts as a histone H3 lysine 4 demethylase, suggesting a potential role in epigenetic regulation during development, cell differentiation (PMID:21575681). KDM5C protein is homologous to three other proteins of the human JARID1 family (JARID1A, JARID1B and JARID1C). This family shares several evolutionarily conserved domains, including the catalytic JmjC domain, JmjN domain, Arid/Bright domain, C5HC2 zinc-finger domain and two plant homeodomains (PHD), a motif that binds methyl-lysine residues (PMID:17320160,17320161).

Selected Validation Data

Immunofluorescent analysis of (10% Formaldehyde) fixed HeLa cells using 14426-1-AP (KDM5C antibody) at dilution of 1:50 and Alexa Fluor 488-conjugated Goat Anti-Rabbit IgG(H+L).

Various lysates were subjected to SDS PAGE followed by western blot with 14426-1-AP (KDM5C antibody) at dilution of 1:2500 incubated at room temperature for 1.5 hours.
