Background Information

MGAT4C is predicted to be a glycosyltransferase that catalyzes a GlcNAc β 1-4 linkage to the core mannose residues of N-glycans, resulting in N-glycans with tri- or tetraantennary structures. Recently MGAT4C has been found to get involved in processing complex N-glycan structures on CD133 and CD133 has been identified as a substrate of MGAT4C. Given to the fact that CD133 is widely used as a marker of numerous stem cell and cancer stem cell types, MGAT4C may have an important role in certain cancers. (PMID: 21937449)
