## Background Information

Actin Filament-Associated Protein of 110 kDa (AFAP-110/AFAP1) is an adaptor protein with multiple protein binding motifs that is known to function as both an actin binding protein and a cSrc activating protein. A homology search of AFAP1 recently identified AFAP1L1 which has a similar sequence, domain structure and cellular localization. AFAP1L1 is highly expressed in human breast, colon and brain tissue. AFAP1L1 interacts with cortactin and involves the invadosomes formation. AFAP1L1 as a prognostic marker has a role in the progression of spindle cell sarcomas.
