Background

NFATC4, also named NFAT3, is a member from the Nuclear Factor of Activated T cells (NFATs) transcription factor family. NFATc4 contains a conserved Rel homology domain (RHD) which includes the DNA-binding motif, and two transactivation domains (TADs) which locate at the N-terminus and C-terminus respectively. NFATC4 is involved in several physiological processes, including the development and function of the immune, cardiovascular, musculoskeletal, and nervous systems. It is also reported that NFATC4 could take part in cell growth, cell migration, tumor metastasis, and patient survival recently.

Synonyms
