Background

CEP162, also known as KIAA1009 and QN1, was found in organisms ranging from trypanosomes to vertebrates. A role for CEP162, involved in required to promote assembly of the transition zone in primary cilia. CEP162 acts by specifically recognizing and binding the axonemal microtubule. CEP162 localizes to the distal ends of centrioles before ciliogenesis and directly binds to axonemal microtubule, thereby promoting and restricting transition zone formation specifically at the cilia base.
