Background Information

AID is essential to all three genetic alterations required for antigen-specific immunoglobulin: class switch recombination (CSR), somatic hypermutation (SHM), and gene conversion. Expression of AID is normally restricted to B cells in the GC, where SHM and CSR occur. It is likely these represent AID monomer and homodimer that western blot detected two bands in purified AID from nuclear extracts, one at 52 kDa and the other at 26 kDa. (PMID:16280388)
