Background Information

Keratins are a large family of proteins that form the intermediate filament cytoskeleton of epithelial cells, which are classified into two major sequence types. Type I keratins are a group of acidic intermediate filament proteins, including K9-K23, and the hair keratins Ha1-Ha8. Type II keratins are the basic or neutral counterparts to the acidic type I keratins, including K1-K8, and the hair keratins, Hb1-Hb6. Keratin 6 is a type II keratin. It is used as marker for epidermal hyperproliferation and differentiation. Three keratin 6 isoforms were found, ketatin 6A, 6B and 6C. They share more than 99% identical DNA sequence. This antibody is against all three isoforms of keratin 6, but it does not bind other keratins.

Selected Validation Data

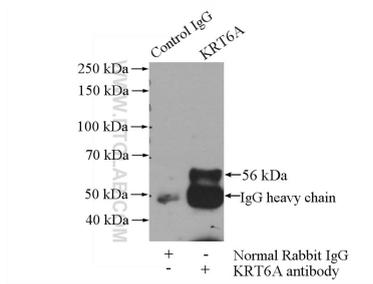

A431 cells were subjected to SDS PAGE followed by western blot with 16853-1-AP (Cytokeratin 6A-specific antibody) at dilution of 1:300 incubated at room temperature for 1.5 hours.

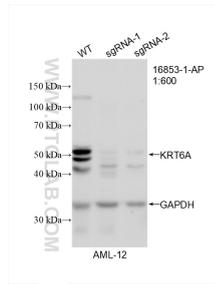

Immunohistochemical analysis of paraffin-embedded skin cancer slide using 16853-1-AP (Cytokeratin 6A-specific antibody) at dilution of 1:200 (under 20x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0).
