Background Information

Zinc transporter ZIP9 subfamily (SLC39A9) encodes a protein with characteristics of a membrane androgen receptor (mAR). Human ZIP9 is a 307-amino acid protein, which has eight putative transmembrane domains. ZIP9 has also been identified and characterized as a resident protein in the Golgi in DT40 and HeLa cell lines (PMID: 19420709, 23505453). ZIP9 may be present on the cell surface, as well as nuclear and mitochondrial membranes, in human breast and prostate cancer cell lines, where it mediates testosterone induction of apoptosis (PMID: 29952128). Knockout of ZIP9 would lead to zinc accumulation in the secretory pathway, which could influence the general ion homeostasis and in turn the glycosylation outcome (PMID: 36648436).
