Background Information

SCD (stearoyl-CoA desaturase) is a 37-45 kDa (PMID:10946019) microsomal fatty acid monodesaturase, also commonly known as 9-desaturase, which catalyses the committed step in the biosynthesis of mono-unsaturated fatty acids from saturated fatty acids. Five SCD genes (SCD1, SCD2, SCD3, SCD4 and SCD5) have been identified and characterized in mice and SCD1 and SCD2 are the main isoforms expressed in mouse liver and brain respectively, SCD3 is expressed exclusively in skin, whereas SCD4 is expressed predominantly in the heart. SCD1 and SCD5 has been the only human SCD gene identified and characterized to date (PMID:15907797). The formation of homodimers and oligomers is an intrinsic property of SCD proteins, which may play an important role in regulating the half-life of the SCD enzymes, thus representing a novel regulatory mechanism for SCD enzymes, in addition to the transcriptional and post-translational regulations. A 32-kDa SCD1 degradation product identified may be caused by a major cleavage site at the C-terminus, thus representing a novel degradation product (PMID:15610069).
