Hintergrundinformationen

Type II a receptor protein tyrosine phosphatases (rPTP σ) are cell surface receptors important for nervous system development, function, and repair. The expression of rPTP σ has previously been reported in b-cells and other target organs for INS although the probes chosen did not permit to distinguish between the splice variants. Proteolytic processing near the transmembrane domain generates an extracellular N-terminal E-domain of 130 kDa and a C-terminal P-domain of approximately 85 kDa of rPTP σ , and the short splice variants rPTP σ 3 and 4 contain an E-domain of 95 kDa (PMID: 16552719). rPTP σ expression was observed in tissue lysates of the adult mouse sensory-motor cortex and thoracic spinal cord (T8-T10) as a 75-80kDa immunoreactive band (PMID: 19780196).
