Hintergrundinformationen

RPGRIP1 is a photoreceptor protein that interacts with retinitis pigmentosa GTPase regulator protein and is a key component of cone and rod photoreceptor cells. The biological functions of RPGRIP1 are complex. Mutations in this gene lead to autosomal recessive congenital blindness. In the eye, it is expressed in amacrine neurons and photoreceptors, and in numerous other tissues, albeit at greatly reduced levels. Moreover, it exists multiple isoforms with species-specific subcellular localization patterns, and the different isoforms perform cell-specific functions. Within photoreceptors, RPGRIP1 localizes predominantly to outer segments (OS) of rods and cones in humans, whereas in bovine eyes, it is found only in rod OS. In contrast, in mice, RPGRIP1 is found primarily in connecting cilia (CC), where it localizes between the ciliary axoneme and the plasma membrane. RPGRIP1 has multiple isoforms with MW 147 kDa, 70-76 kDa, 103 kDa, and 66 kDa.
