## Hintergrundinformationen

KH domain-containing, RNA-binding, signal transduction-associated protein 3 (KHDRBS3, SLM2) is a RNA-binding protein that plays a role in the regulation of alternative splicing and influences mRNA splice site selection and exon inclusion (15901763). May play a role as a negative regulator of cell growth. Inhibits cell proliferation. Involved in splice site selection of vascular endothelial growth factor. Induces an increased concentration-dependent incorporation of exon in CD44 pre-mRNA by direct binding to purine-rich exonic enhancer. RNA-binding abilities are down-regulated by tyrosine kinase PTK6. Involved in post-transcriptional regulation of HIV-1 gene expression (11741900). Ubiquitous with higher expression in testis, skeletal muscle and brain. Expressed in the kidney only in podocytes, the glomerular epithelial cells of the kidney. Strongly expressed after meiosis. This antibody is a rabbit polyclonal antibody raised against a full-length human KHDRBS3 protein. The observed molecular weight of KHDRBS3 is about 55kd.
