Hintergrundinformationen

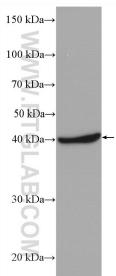

Rab9 GTPase is required for the transport of mannose 6-phosphate receptors from endosomes to the trans-Golgi network in living cells, and in an in vitro system that reconstitutes this process. P40 is an effector of Rab9 that interacts preferentially with the active form of Rab9. p40 does not interact with Rab7 or K-Ras; it also fails to bind Rab9 when it is bound to GDI. The protein is found in cytosol, yet a significant fraction (~30%) is associated with cellular membranes. P40 is a very potent transport factor in that the pure, recombinant protein can stimulate, significantly, an in vitro transport assay that measures transport of mannose 6-phosphate receptors from endosomes to the trans-Golgi network.

Ausgewählte Validierungsdaten

HepG2 cells were subjected to SDS PAGE followed by western blot with 15105-1-AP (RABEPK/p40 antibody) at dilution of 1:6000 incubated at room temperature for 1.5 hours.

1X10⁶ HeLa cells were intracellularly stained with 0.2 ug Anti-Human RABEPK/p40 (15105-1-AP) and Coralite® 488-Conjugated AffiniPure Goat Anti-Rabbit IgG(H+L) at dilution 1:1000 (green), and 0.2 ug Control Antibody. Cells were fixed with 90% MeOH.
