## Hintergrundinformationen

ERBB4, also named as p180erbB4 and HER4, belongs to the protein kinase superfamily, Tyr protein kinase family and EGF receptor subfamily. ERBB4 specifically binds and it is activated by neuregulins, NRG-2, NRG-3, heparin-binding EGF-like growth factor, betacellulin and NTAk. Interaction with these factors induces cell differentiation. ERBB4 is not activated by EGF, TGF-A, and amphiregulin. ERBB4 catalyze the reaction: ATP + a [protein]-L-tyrosine = ADP + a [protein]-L-tyrosine phosphate. The antibody recognize the C-term of ERBB4. Alternatively spliced variants which encode different protein isoforms with calculated molecular weight of 144-147 kDa have been described. The apparent molecular weight of full-length ERBB4 is 150-200 kDa due to glycosylation and phosphorylation. Full-length ERBB4 can be cleaved into an 80-kDa ERBB4 intracellular fragment and a 120-kDa extracellular fragment (PMID: 11343971; 16251361).

## Ausgewählte Validierungsdaten

mouse brain tissue were subjected to SDS PAGE followed by western blot with 19943-1-AP (ERBB4 antibody) at dilution of 1:300 incubated at room temperature for 1.5 hours.

Frozen tissue section of embryonic mouse heart (E12.5) was stained for cardiac troponin T/cTnT (green) and ErbB4 (red, Cat. No 19943-1-AP) with DAPI as a counterstain for visualizing the nucleus (blue). cTnT stains cardiomyocytes and was visualized with an Alexa Fluor 488 secondary antibody. ErbB4 is a key member of ErbB signaling and involved in development and was visualized with an Alexa Fluor 555 secondary antibody. The Image and figure legends are intellectual
