## Hintergrundinformationen

SLC6A19, also named as B0AT1, encodes system B(0) transmembrane protein that mediates epithelial resorption of neutral amino acids across the apical membrane in kidney and intestine (PubMed: 15044460). The protein contains 634 amino acids and has 12 predicted transmembrane regions with highly expression in human kidney and small intestine and minimal in pancreas (PubMed: 15286787). The expression of SLC6A19 in intestinal cells depends on angiotensin converting enzyme 2 which is the cellular receptor for SARS-CoV-2 (PubMed: 32132184). Mutations in SLC6A19 cause Hartnup disease (PMID: 15286787, PMID: 15286788).
