Hintergrundinformationen

Activated leukocyte cell adhesion molecule (ALCAM, also known as CD166) is a cell adhesion molecule that belongs to the immunoglobulin superfamily. It is involved in cell-cell adhesion through homophilic and heterophilic (to CD6) interactions. ALCAM is widely expressed in a variety of normal tissues and cell types, including activated T cells and monocytes, epithelial cells, fibroblasts, neuronal cells, hepatocytes, and bone marrow mesenchymal stem cells (PMID: 7760007; 25221999). Altered ALCAM expression has been associated with the differentiation state and progression in some neoplasms including melanoma, prostate, colorectal, and breast cancers (PMID: 20461761; 18172759).

Ausgewählte Validierungsdaten

1×10^6 PHA treated human PBMCs were surface stained with 0.2 μ g Anti-Human ALCAM (65223-1-Ig, Clone:3A6) and CL594-Goat anti-Mouse IgG at dilution 1:1000 (red) or unstained (blue). Cells were not fixed. Monocytes were gated.
