

PPAR Gamma Monoklonaler Antikörper

Katalog-Nr.: **66936-1-Ig** **3 Publikationen**

Allgemeine Informationen

Katalog-Nr.:	66936-1-Ig	GenBank-Zugangsnummer:	BC006811	Reinigungsmethode:
Größe:	150ul , Konzentration: 2000 µg/ml von 5468 Nanodrop und 833 µg/ml durch die Bradford-Methode mit BSA als Standard;	GenID (NCBI):	Vollständiger Name: peroxisome proliferator-activated receptor gamma	Protein-A-Reinigung CloneNo.: 1F4A2
Wirt:	Maus	Berechneté Masse:	58 kDa	Empfohlene Verdünnungen: WB 1:5000-1:50000 IHC 1:250-1:1000 IF 1:200-1:800
Isotyp:	IgG1	Beobachteté Masse:	50 kDa	
Immunogen Katalognummer:	AG16657			

Anwendungen

Geprüfte Anwendungen:	Positivkontrollen:
FC, IF, IHC, WB, ELISA	WB : HepG2-Zellen, A431-Zellen, A549-Zellen, HL-60-Zellen, K-562-Zellen, Maus-Fettgewebe, MCF-7-Zellen, PC-3-Zellen
In Publikationen genannte Anwendungen:	IHC : humanes Prostatakarzinomgewebe, humanes Kolonkarzinomgewebe
IF, IHC, WB	IF : HepG2-Zellen,
Getestete Reaktivität:	
Human, Maus	
Zitierte Arten:	
Human, Maus	
Hinweis-IHC: Antigendemaskierung mit TE-Puffer pH 9,0 empfohlen. (*) Wahlweise kann die Antigendemaskierung auch mit Citratpuffer pH 6,0 erfolgen.	

Hintergrundinformationen

Peroxisome Proliferator-Activated Receptors (PPARs) are ligand-activated intracellular transcription factors, members of the nuclear hormone receptor superfamily (NR), that includes estrogen, thyroid hormone receptors, retinoic acid, Vitamin D3 as well as retinoid X receptors (RXRs). The PPAR subfamily consists of three subtypes encoded by distinct genes denoted PPAR α (NR1C1), PPAR β/δ (NR1C2) and PPAR γ (NR1C3), which are activated by selective ligands. PPAR γ , also named as PPARG, contains one nuclear receptor DNA-binding domain and is a receptor that binds peroxisome proliferators such as hypolipidemic drugs and fatty acids. It plays an important role in the regulation of lipid homeostasis, adipogenesis, INS resistance, and development of various organs. Defects in PPARG are the cause of familial partial lipodystrophy type 3 (FPLD3) and may be associated with susceptibility to obesity. Defects in PPARG can lead to type 2 INS-resistant diabetes and hypertension. PPARG mutations may be associated with colon cancer. Genetic variations in PPARG are associated with susceptibility to glioma type 1 (GLM1). PPARG has two isoforms with molecular weight 57 kDa and 54 kDa (PMID: 9831621), but modified PPARG is about 67 kDa (PMID: 16809887). PPARG2 is a splice variant and has an additional 30 amino acids at the N-terminus (PMID: 15689403). Experimental data indicate that a 45 kDa protein displaying three different sequences immunologically related to the nuclear receptor PPARG2 is located in mitochondria (mt-PPAR). However, the molecular weight of this protein is clearly less when compared to that of PPARG2 (57 kDa) (PMID: 10922459). PPARG has been reported to be localized mainly (but not always) in the nucleus. PPARG can also be detected in the cytoplasm and was reported to possess extra-nuclear/non-genomic actions (PMID: 17611413; 19432669; 14681322).

Lagerung

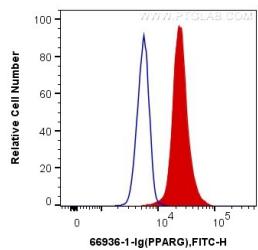

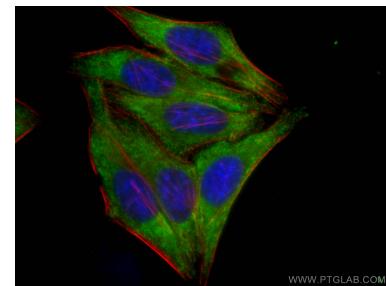

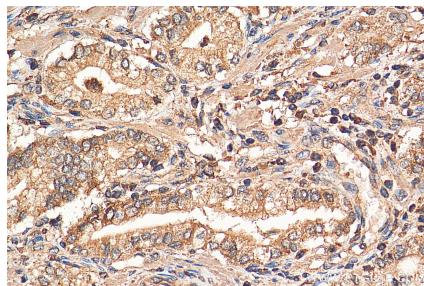

Lagerungsbedingungen:
Bei -20°C lagern. Nach dem Versand ein Jahr lang stabil
Lagerungspuffer:
PBS mit 0.02% Natriumazid und 50% Glycerin pH 7.3.
Aliquotieren ist nicht notwendig bei -20°C Lagerung

*** 20ul-Größen enthalten 0.1% BSA

Ausgewählte Validierungsdaten

Various lysates were subjected to SDS PAGE followed by western blot with 66936-1-Ig (PPARG antibody) at dilution of 1:10000 incubated at room temperature for 1.5 hours.

1X10⁶ HeLa cells were intracellularly stained with 0.4 ug Anti-Human PPAR Gamma (66936-1-Ig, Clone:1F4A2) and CoraLite®488-Conjugated AffiniPure Goat Anti-Mouse IgG(H+L) at dilution 1:1000 (red), or 0.4 ug Control Antibody. Cells were fixed and permeabilized with Transcription Factor Staining Buffer Kit (PF00011).
