Hintergrundinformationen

PPM1D (also known as PP2Cd and WIP1) is a member of the PPM family, which is characterized by Mg²⁺/Mn²⁺-dependent activity and relative insensitivity to okadaic acid. The PPM1D gene is aberrantly amplified in a range of common cancers and encodes a protein phosphatase that is a potential therapeutic target (PMID: 17700519). This antibody can be detected two bands of 47 and 67 Kda.
