Hintergrundinformationen

CD206, also named as MMR, CLEC13D and MRC1, is a type I membrane receptor that mediates the endocytosis of glycoproteins by macrophages. CD206 has been shown to bind high-mannose structures on the surface of potentially pathogenic viruses, bacteria, and fungi so that they can be neutralized by phagocytic engulfment. CD206 is a 170 kDa transmembrane protein which contains 5 domains: an amino-terminal cysteine-rich region, a fibronectin type II repeat, a series of eight tandem lectin-like carbohydrate recognition domains (responsible for the recognition of mannose and fucose), a transmembrane domain, and an intracellular carboxy-terminal tail. It is expressed on most tissue macrophages, in vitro derived dendritic cells, lymphatic and sinusoidal endothelia.

Ausgewählte Validierungsdaten

Human monocyte-derived dendritic cells (monocytes stimulated with GM-CSF and IL-4) were surface stained with 4 μ l FITC Anti-Human CD206 (FITC-65155, Clone: 15-2) (green) or FITC-Mouse IgG1 isotype control (black). Cells were not fixed.
