Informations générales

Snapin, a protein of relative molecular weight of 15kd, is implicated in neurotransmission by binding to SNAP-25. Snapin was enriched in neurons and exclusively located on synaptic vesicle membrane, which may be a PKA target for modulating transmitter release through the cAMP-dependent signal-transduction pathway. This antibody can recognize the 15-18kd(Monomer) and 30-36kd(Dimer) forms of SNAPIN.
