## Informations générales

In eukaryotes, the translation elongation factor eEF 1A responsible for transporting amino-acylated tRNA to the ribosome forms a higher-order complex, eEF 1H, with its guanine-nucleotide-exchange factor eEF 1B. eEF 1B consists of three subunits: eEF 1B alpha, eEF 1B beta and eEF 1B gamma. The eEF 1B possess the nucleotide-exchange activity. Although several models on the basis of in vitro experiments have been proposed for the macromolecular organization of the eEF 1H complex, these models differ in various aspects. The human eukaryote elongation factor 1 beta 2 (eEF 1B2) migrated as a 30 kDa protein in SDS-PAGE. This antibody is a rabbit polyclonal antibody raised against full length EEF1B2 of human origin.
