## Informations générales

SIX1 belongs to SIX family that contains a divergent DNA-binding homeodomain and an upstream SIX domain, which may participate both in determining DNA-binding specificity and in mediating protein-protein interactions. It may be involved in limb tendon and ligament development, and specifically expressed in skeletal muscle. SIX1 plays a essential role in the development of numerous organs and shows littlt to no expression in most non-neoplastic adult tissue, yet is overexpression in a number of meoplasmms where it increases cell proliferation and survival. The calculated molecular weight of SIX1 is 32kDa, but modified SIX1 is about 35 kDa.
