Informations générales

Aquaporins (AQPs), also known as water channel proteins, are members of a large protein family that osmotically modulate water fluid homeostasis in several tissues. AQP9 (Aquaporin 9) is a member of the aquaporin family that acts as a water-selective membrane channel, and it may be involved in cell migration, angiogenesis, and tumor growth. AQP9 is involved in arsenic uptake in hepatocellular carcinoma cells, in which p38-MAPK may play a limited role. AQP9 was demonstrated to promote astrocytoma cell invasion and motility via the AKT pathway.
