## Informations générales

Axis inhibition protein2 (AXIN2), also known as Cuductin or Axil, is a multidomain scaffold protein that negatively regulates Wnt signaling. AXIN2 can directly interact with beta-catenin and GSK3B. AXIN2 has a number of phosphorylation sites, and also can undergo poly(ADP-ribosylation) by tankyrase TNKS and TNKS2. Poly(ADP-ribosylation)ated AXIN2 then get ubiquitinated by RNF146 and leads to its degradation and subsequent activation of Wnt signaling. AXIN2 is localized in the cytoplasm and its mutation is involved in colorectal cancer. Catalog# 20540-1-AP is a rabbit polyclonal antibody raised against a 34 amino acid N-terminal of human AXIN2. Observed MW of AXIN2 is from 93-100 kDa (PMID: 11809809; 24607787).
