## Informations générales

ROM1 (also known as TSPAN23) is a transmembrane protein present in photoreceptor outer segment disc membranes. ROM1 belongs to the tetraspanin superfamily, which are characterized by the presence of four conserved transmembrane regions. Tetraspanins have been involved in diverse processes such as cell activation and proliferation, adhesion and motility, differentiation, and cancer. ROM1 is required for rod photoreceptor viability and the regulation of disk morphogenesis (PMID: 10802659). It may function as an adhesion molecule involved in stabilization and compaction of outer segment disks.
