Informations générales

The Sodium Channel, Voltage-Gated, Type II, Alpha (SCN2A) gene encodes the neuronal sodium channel NaV1.2. There are two major developmentally regulated splice isoforms of NaV1.2 that use mutually exclusive copies of the fifth coding exon and differ by one amino acid at position 209: Asparagine (Asn/N) vs. Aspartic acid (Asp/D). NaV1.2 is one of several sodium channels involved in initiation and propagation of action potentials in neurons. It's widely expressed throughout the human central nervous system, but not in peripheral tissues. (PMID: 29691040)
