Informations générales

Two RNA m6A demethylases, FTO and ALKBH5, have been identified since 2011, with both capable of removing the methyl group of m6A on poly-adenylated RNA through an iron-dependent oxidative demethylation mechanism. ALKBH1 as a RNA demethylase that mediates removal of the methyl group from N1-methyladenosine (m1A) in tRNA. ALKBH1 can tune translation initiation and elongation by regulating the cellular levels of tRNA^{iMet} and the association of other ALKBH1 target tRNAs to polysomes, thereby affecting protein synthesis.
