## Informations générales

Epidermal Growth Factor Receptor (EGFR) is one of the receptor tyrosine kinases (RTKs), members of the ErbB/HER family which consists of ErbB1 (EGFR or HER1), ErbB2 (HER2 or Neu), ErbB3 (HER3), and ErbB4 (HER4). Aberrant activation of EGFR is among the most common oncogenic driving events in human cancer, which is mediated largely through different classes of genomic alterations within the EGFR gene. Autophosphorylation at Tyr-1092 and/or Tyr-1110 recruits STAT3. (PMID: 35164092, PMID: 29464683, PMID: 37085908). Some scientists call EGFR Tyr1092 as EGFR Tyr1068, the site where the signaling peptide is removed.

## Données de validation sélectionnées

Non-treated HeLa and EGF treated HeLa cells were subjected to SDS PAGE followed by western blot with 30278-1-AP (Phospho-EGFR (Tyr1092) antibody) at dilution of 1:1500 incubated at room temperature for 1.5 hours. The membrane was stripped and re-blotted with Vinculin antibody as loading control.
