Informations générales

Ankyrin repeat and IBR domain-containing protein 1 (ANKIB1) is also named as KIAA1386, and belongs to the RBR family. ANKIB1 might act as an E3 ubiquitin-protein ligase, or as part of E3 complex, which accepts ubiquitin from specific E2 ubiquitin-conjugating enzymes and then transfers it to substrates. The common biomarkers found within the H and EC region of brain are ZNF621, SLC25A46, RAE1, and ANKIB1. Among these biomarkers, RAE1, ANKIB1, and SLC25A46 have been reported to be prominently involved in several neurodegenerative disorders (PMID:33878365). ANKIB1 is also found to be associated with Cerebral cavernous malformations (PMID:20798775).
