Informations générales

Ribosomal protein S6 (RPS6). Phosphoprotein NP33. It may play an important role in controlling cell growth and proliferation through the selective translation of particular classes of mRNA. Ribosomal protein S6 is the major substrate of protein kinases in eukaryote ribosomes. The phosphorylation is stimulated by growth factors, tumor promoting agents, and mitogens. It is dephosphorylated at growth arrest. Phosphorylated at Ser-235 and Ser-236 by RPS6KA1 and RPS6KA3; phosphorylation at these sites facilitates the assembly of the preinitiation complex.

Données de validation sélectionnées

Various lysates were subjected to SDS PAGE followed by western blot with 80208-1-RR (S6 Ribosomal protein antibody) at dilution of 1:15000 incubated at room temperature for 1.5 hours.

Immunofluorescent analysis of (-20°C Methanol) fixed HepG2 cells using S6 Ribosomal protein antibody (80208-1-RR, Clone: 6L9) at dilution of 1:200 and Coralite®488-Conjugated AffiniPure Goat Anti-Rabbit IgG(H+L).
