Informations générales

There are five tubulins in human cells: alpha, beta, gamma, delta, and epsilon. Tubulins are conserved across species. They form heterodimers, which multimerize to form a microtubule filament. An alpha and beta tubulin heterodimer is the basic structural unit of microtubules. The heterodimer does not come apart, once formed. The alpha and beta tubulins, which are each about 55 kDa MW, are homologous but not identical. Alpha, beta, and gamma tubulins have all been used as loading controls. Tubulin expression may vary according to resistance to antimicrobial and antimetabolic drugs.

Données de validation sélectionnées

Immunofluorescent analysis of (4% PFA) fixed HeLa cells using Coralite®594 Beta Tubulin antibody (CL594-10068) at dilution of 1:200.

1X10⁶ HeLa cells were intracellularly stained with 0.4 ug Coralite®594 Anti-Human Beta Tubulin (CL594-10068) (red), or 0.4 ug Control Antibody. Cells were fixed with 4% PFA and permeabilized with Flow Cytometry Perm Buffer (PF00011-C).
