## Background Information

During the translation processes, aminoacyl-tRNA synthetases (ARSs) ligate specific amino acids to tRNAs. Together with non-enzymatic proteins called ARS-interacting multifunctional proteins (AIMPs), the ARSs form a macromolecular complex [PMID:15286174]. This complex has an essential role in protein synthesis, but also in other biological processes including angiogenesis, apoptosis, and inflammation. [PMID:21789020] AIMP3 is not only associated with the multi-tRNA synthetase complex via its specific interaction with methionyl-tRNA synthetase, but also works as a tumor suppressor by interacting with ATM, the upstream kinase of p53 [PMID:18343821].
