Background Information

Globin genes' expression in the β -globin cluster is restricted to erythroid cells, with five different genes expressed during embryonic (e), fetal (G γ and A γ), and adult (δ and β) development [PMID:9461381]. Transcriptional activation of globin genes occurs not only by the binding of transcriptional activator proteins to the promoter of the gene being activated but also by a regulatory element located 6 to 18 kb upstream of the β -globin cluster, the locus control region (LCR)[PMID:8791532]. DXL4, also known as BP1, binds to two silencer DNA sequences upstream of the adult human β -globin gene and to a negative control region upstream of the adult δ -globin gene [PMID:11909945].
