Background Information

PSMF1 is also named as PI31(proteasome (prosome, macropain) inhibitor subunit 1) and belongs to proteasome inhibitor PI31 family. PI31, which localizes at the nuclear envelope/endoplasmic reticulum membrane, acts as a selective modulator of the proteasome-mediated steps in MHC class I antigen processing(PMID:18495667). PI31 does not inhibit cell-surface transport of glycoproteins in general and it may serve to control immunoproteasome formation and may thereby maintain an intracellular balance between constitutive and immunoproteasomes(PMID:12374861).
