## **Background Information**

The formyl peptide receptors (FPRs) are a group of G protein-coupled chemoattractant receptorsthat play important roles in host defense and inflammation (PMID: 28335409). In humans, three different isoforms are expressed (FPR1, FPR2, and FPR3). FPR2, also known as FPRL1 or ALX, is expressed by many cell types including monocytes, neutrophils, macrophages, astrocytoma cells, epithelial cells. FPR2 conveys the biological functions of a variety of ligands, including N-formyl-methionyl peptides, the proresolution mediators annex in A1 (AnxA1) and lipox in A4, as well as the activating and proinflammatory protein serum amyloid A (PMID: 22610094).
