Background Information

Cyclic nucleotide phosphodiesterases (PDEs) catalyze hydrolysis of the cyclic nucleotides cAMP and cGMP to the corresponding nucleoside 5-prime-monophosphates. PDE1C, is calmodulin-dependent PDEs (CaM-PDEs) that are stimulated by a calcium-calmodulin complex. Expression of PDE1C may be an important component in signal transduction pathways mediated by calcium that permit cell cycle traverse and proliferation(PMID:9366577). It has 2 isoforms produced by alternative splicing.
