Background Information

ADAM22 is a transmembrane protein with an extracellular disintegrin and catalytically inactive metalloproteinase domain that is thought to participate in cell-cell and cell-matrix interactions. It is a component of the Kv1 channel protein complex. ADAM22 is previously reported to regulate synaptic transmission and to be a binding partner of leucine-rich glioma inactivated 1 (Lgi1), which is mutated in autosomal-dominant partial epilepsy with auditory features (PMID: 20089912). It has 5 isoforms produced by alternative splicing. This protein has a signal peptide, a propeptide and 4 glycosylation sites.
