Background Information

HAGHL, or HAGHL gene, is a gene located on chromosome 16p13.3, and it encodes a protein that has been identified as a novel metabolic oncogene involved in the progression of human colorectal cancer (CRC). Recent studies have demonstrated that HAGHL plays a critical role in regulating CRC by influencing various metabolic pathways, which may contribute to tumor growth and development. (PMID: 36417085)

Selected Validation Data

K-562 cells were subjected to SDS PAGE followed by western blot with 15514-1-AP (HAGHL antibody) at dilution of 1:1000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 15514-1-PBS in a different storage buffer formulation.
