Background Information

SQRDL(Sulfide:quinone oxidoreductase, mitochondrial) catalyzes the oxidation of hydrogen sulfide, with the help of a quinone. Although the SQRDL precursor protein displays a molecular weight of 50 kDa, a prominent band at about 46 kDa is detected by western blot. This discrepancy reflects the cleavage of an N-terminal targeting sequence of 4 kDa during the import of the protein into the mitochondria(PMID:22067608). SQRDL is one of the enzymes involved in H₂S signaling in a discrete population of neurons, oligodendrocytes, and endothelial cells.
