## Background Information

Hyaluronic acid (HA), a glycosaminoglycan that is ubiquitously present in the extracellular space of higher animals, maintains matrix structure and controls cellular functions such as proliferation, differentiation, and locomotion. Hyal enzymes that catabolize HA, are involved in development and tumorigenesis. HYAL4, a member of the Hyal family, is a chondroitin sulfate (CS)-specific endo-β-acetylgalactosaminidase. The expression of hHYAL4 mRNA is not ubiquitous but restricted to placenta, skeletal muscle, and testis (PMID: 23086929). This polyclonal antibody raised against 29-460aa of human HYAL4. The apparent molecular weight is larger than the calculated molecular weight of 54 kDa, which is likely due to posttranslational modification, presumably by glycosylation (PMID: 19889881).
