## Background Information

ND4L, also named as MTND4L and NADH4L, belongs to the complex I subunit 4L family. It is a core subunit of the mitochondrial membrane respiratory chain NADH dehydrogenase (Complex I) that is believed to belong to the minimal assembly required for catalysis. Complex I functions in the transfer of electrons from NADH to the respiratory chain. The immediate electron acceptor for the enzyme is believed to be ubiquinone. Mutation of ND4L will cause Leber hereditary optic neuropathy (LHON) which is a maternally inherited disease resulting in acute or subacute loss of central vision, due to optic nerve dysfunction.
