Background Information

Phospholipase A2 (PLA2) enzymes catalyze hydrolysis of glycolipids to release free fatty acids and lysophospholipids. PLA2G12B is a secreted group XIIIB secretory phospholipase A2-like protein belonging to the PLA2 family, but it is catalytically inactive due to an amino acid change in its active site and has altered phospholipid-binding properties (PMID: 14516201). PLA2G12B is strongly expressed in liver, small intestine and kidney, and recently reports revealed that Pla2g12b gene may be implicated in HDL cholesterol levels and metabolism (PMID: 22912808).
