Background Information

NPFFR2, also named as GPR74, NPFF2 and NPGPR, belongs to the G-protein coupled receptor 1 family. NPFFR2 is a receptor for NPAF (A-18-F-amide) and NPFF (F-8-F-amide) neuropeptides which also known as morphine-modulating peptides. NPFFR2 can also be activated by a variety of naturally occurring or synthetic FMRF-amide like ligands. NPFFR2 mediates its action by association with G proteins that activate a phosphatidylinositol-calcium second messenger system. The antibody can recognize isoform1, isoform2 and isoform3 of NPFFR2.
