Background Information

VNN1 (Vascular non-inflammatory molecule 1) is also named as Vanin-1, Pantetheinase, Tiff66. It is a GPI-anchored 70-kDa protein with a high degree of homology with GPI-80 (also known as VNN2), a molecule expressed by human phagocytes and involved in leukocyte adhesion and migration. Vanin-1 is predominantly expressed by resident tissue cells and acts at the level of epithelial cells and surrounding hematopoietic cells by paracrine 2-Mercaptoethylamine release (PMID:17163446). The full length VNN1 has a signal peptide, a propeptide and six glycosylation sites. According to some authors, the variations which varied between 55 and 72 kDa may be due to different degrees of glycosylation of the protein and cleavage (JOSE A et al. 2001).

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 21745-1-AP (VNN1 antibody) at dilution of 1:2000 incubated at room temperature for 1.5 hours.

BxPC-3 cells were subjected to SDS PAGE followed by western blot with 21745-1-AP (VNN1 antibody) at dilution of 1:300 incubated at room temperature for 1.5 hours.
