## Background Information

CCL27, also known as CTACK, is a member of the CC chemokine subfamily. CCL27 is predominantly expressed in skin and selectively attracts cutaneous lymphocyte antigen-positive T cells and Langerhans cells. The CCL27 secreted from keratinocytes was reportedly involved in inflammatory skin diseases such as atopic dermatitis, contact dermatitis, and psoriasis. CCL27 is a ligand to CCR10. The binding of CCL27 to CCR10 on T cells promotes their migration to the skin, where they can then participate in local immune responses.
