Background Information

PPP1R14C, found as a morphine-regulated brain gene, encodes protein phosphatase 1 regulatory inhibitor subunit 14C, and is identified as a potent inhibitor of PP1. Horvath and colleagues reported that PPP1R14C inhibited the release of neurotransmitters and promoted neuronal exocytosis by retaining synaptosome associated protein 25 (SNAP25) at a phosphorylated state. Moreover, overexpression of PPP1R14C increased the phosphorylation of RB transcriptional co-repressor 1 (RB1) to protect leukemic cells from chemotherapy.
